## SUMMARY

---

Documentation engineer specializing in eval-driven knowledge optimization and information architecture for production AI systems, with 7+ years in technical documentation and knowledge systems, remote preferred. Over 4+ years fully remote at Meta, I built closed-loop systems that analyze failed AI-agent conversations, identify knowledge gaps, and route source-grounded fixes back into content — improving agent answer quality by +9.3pp across supported products while reducing hallucinations. I was the first in the company to quantify AI consumption of documentation at the per-document level, inventing retrieval and knowledge-retrieval-optimization metrics later adopted as company-wide standards.

## SKILLS

---

**AI & Evaluation:** Retrieval-Augmented Generation (RAG), LLM evaluation, retrieval quality, knowledge optimization, prompt engineering, LLM-as-judge methodology, agent orchestration, golden datasets

**Documentation & Strategy:** AI knowledge systems, information architecture, knowledge management, content optimization, documentation quality, technical writing

**Data & Analytics:** SQL, JSON, documentation analytics, metrics strategy, dashboard development, statistical methods

**Domains:** People Products, HR technology, knowledge engineering, AI/LLM evaluation infrastructure, developer tools

**Leadership & Process:** Cross-functional coordination, program management, mentorship, content roadmap planning, public speaking

## EXPERIENCE

---

**Meta** — *Information Solutions Engineer / AI Knowledge Architect* *Nov 2021 - Present*

- **Pioneered AI-documentation metrics** — first in the company to measure AI consumption of docs at the per-document level, developing retrieval and citation metrics later adopted as company-wide standards. Surfaced the inflection point that AI consumption surpassed human consumption, driving shifts in content and engagement strategy and shaping the function's two-year AI roadmap.
- **Demonstrated that AI-agent answer quality is strongly predictable from retrieved-document characteristics alone**, enabling teams to improve agent performance through targeted knowledge optimization rather than model tuning.
- **Built and productionized a closed-loop AI knowledge optimization system** driven by online evaluation of production AI agent trajectories. Automated content-gap detection, remediation drafting, review routing, publishing, and re-evaluation across 49 products. In a single quarter, processed 35,724 user prompts, surfaced 914 knowledge gaps, generated 1,189 LLM-drafted remediations at \$0.33 per gap, and drove a +9.3pp lift in eval pass rate across supported products.
- **Lifted on-scope answer pass rate by +19.2pp** on one of the company's highest question-volume internal products through targeted content fixes identified using pre/post eval methodology to pinpoint gaps and verify the lift. Cut content-staleness signal 79% in the same window.
- **Diagnosed and resolved LLM failure modes in production** — redesigned prompting strategy, judge prompts, and citation-verification logic to reduce false-positive abstentions in a retrieval-augmented generation evaluation pipeline.
- **Built and launched the AI Doc Consumption Dashboard** — the measurement layer for AI-driven documentation strategy across 300M+ retrievals, 54M+ distinct documents, and 19 document types — unifying telemetry across three internal AI agent platforms. Now the canonical company source for measuring AI vs. human documentation consumption.
- **Designed and shipped a Documentation Health Analytics Platform** covering 600+ internal products, architecting the pipeline from product registry through aggregation to a real-time dashboard. Drove doc coverage from 44.1% → 73.9% in a single half.

- **Led metrics strategy for the documentation team**, defining measurement standards, setting North Star goals and OKRs, and mentoring colleagues in SQL, analytics, and dashboarding. Promoted 3 times in 4 years (Junior → Staff).

**Living Computers: Museum + Labs** — *Staff Writer*

*Apr 2017 - Jul 2020*

- Managed and edited the museum's blog and refined its editorial voice with stakeholders; created technically accurate content with engineers and historians to make vintage computing systems legible to lay and expert audiences across written, video, and live formats.

**Geek Serv LLC** — *Founder / Owner / Operator*

*May 2008 - Apr 2017*

- Founded and scaled an IT services company serving thousands of clients across the Puget Sound region; built custom internal software with all accompanying documentation.

## **EDUCATION**

---

**B.A. Philosophy** — The Colorado College, Colorado Springs, CO
